ASM LAB ASSIGNMENT 1

Name: Hrithvik Kondalkar Roll: 002211001088

1. Write an Assembly Language Program to add two byte integers and store the result in DX register.

```
.model small
.stack 100h
.data
   var1 db 02h
   var2 db 06h
.code
   main proc
       mov ax, @data
       mov ds, ax
       mov dl, var1
       add dl, var2
       add dl, 48
       mov ah, 02h
       int 21h
       mov ah, 4ch
       int 21h
   main endp
   end main
```

2. Write an 8086 Assembly Language Program to subtract two 8-bit signed integers. The numbers can be stored in the data segment.

```
.model small
.stack 100h
.data
    var1 db 9
    var2 db 3
.code
    main proc
       mov ax, @data
       mov ds, ax
       mov dl, var1
        sub dl, var2
        add dl, 48
       mov ah, 02h
        int 21h
       mov ah, 4ch
       int 21h
    main endp
    end main
```

3. Write an Assembly Language Program to print your name, which is stored in memory as a string.

```
.model small
.stack 100h
.data
    msg1 db 'hrithvik$'
.code
    main proc
    mov ax, @data
    mov ds, ax

    mov dx, offset msg1

    mov ah, 09h
    int 21h

    mov ah, 4ch
    int 21h
    main endp
end main
```

4. Write an Assembly Language Program to reverse a string using stack and display the result.

```
.model small
.stack 100h
.data
   string db "hrithvik$"
.code
   main proc
       mov ax, @data
        mov ds, ax
       mov si, offset string
        mov cx, 8
        tostack:
           push [si]
            inc si
        loop tostack
        mov cx, 8
        mov ah, 02h
        print:
            pop dx
            int 21h
        loop print
        mov ah, 4ch
        int 21h
   main endp
    end main
```

5. Write an 8086 Assembly Language Program which will ask for a number and the no. will be taken from keyboard. Print the number in decimal, binary and hexadecimal format.

```
strprint macro str
                                    binary:
                                                                   hex:
    mov\ dx, offset str
                                                                           xor ax, ax
    mov ah, 09h
                                            xor ax, ax
                                                                           mov cl, 16
    int 21h
                                            mov cl, 2
                                                                           mov al, num
                                            mov al, num
                                                                           mov bl, 0
endm
                                            mov bl, 0
                                                                           tohex:
.model small
                                                                                div cl
.stack 100h
                                            tobinary:
                                                                               xor dx, dx
                                                                               mov dl, ah
.data
                                                div cl
                                                                                cmp ah, 10
    inpnumstr db 100 dup("$")
                                                mov bh, al

                                                                               poploop:
            mov [si], al
                                                loop crtstr
                                                                                    pop dx
            sub al, 48
                                                                                   int 21h
            mov dl, al
                                                                                loop poploop
            xor ax, ax
            mov al, num
                                                                           mov ah, 4ch
            mul cl
                                                                           int 21h
            mov num, al
                                                                       main endp
                                                                       nextline proc
            add num, dl
                                                                           mov dx, 10
            inc si
        ine getnum
                                                                           mov ah, 2
                                                                           int 21h
                                                                           mov dx, 13
                                                                           int 21h
                                                                           ret
                                                                       nextline endp
                                                                       end main
```

6. Now modify the program in Q2 so that it will ask for your name and takes the input from keyboard.

```
.model small
.stack 100h
.data
   str1 db 100 dup('$')
.code
   main proc
        mov ax, @data
        mov ds, ax
        mov si, offset str1
        uinp:
            mov ah, 01h
            int 21h
            mov [si], al
            inc si
            cmp al, 13
        jne uinp
        mov dx, offset str1
        mov ah, 09h
        int 21h
       mov ah, 4ch
        int 21h
   main endp
   end main
```

7. Write an Assembly Language Program to check the length of a given string.

```
.model small
.stack 100h
.data
   string db "hrithvik$"
.code
   main proc
       mov ax, @data
       mov ds, ax
       mov si, offset string
       mov dl, '0'
        eostring:
           mov al, [si]
            cmp al, '$'
            je finish
            add dl, 1
            inc si
            jmp eostring
        finish:
            mov ah, 02h
            int 21h
            mov ah, 4ch
            int 21h
   main endp
   end main
```
